

Difficulties I faced:

1)Being a beginner in the the web development,I had to learn everything from scratch in the short period of 2 weeks. Also when you learn too many skill all at a time, things get little messed up too. So faced a lot of confusion also.

2)My approach was whatever feature, I wanted to add, I just made it separately rather than directly putting it directly in the existing code. So later on when I integrated all the features into one that was also a tough task.

3)For adding any feature, I went for many searches and many different codes were available but some were wriiten in Javascript or some uses JQuery and other languages /frameworks .So I had to go through the basics of them to understand the code.
