Things I learnt and the agile methodology I follow during Engage:

1)I learnt HTML,CSS,Javascript and Jquery for the frontend and for backend part, I learnt Nodejs, Websocket,Mongo DB and Webrtc and other client APIs.

It was the basics which I learnt initially ,then after applying to the project, I get to understand more and debugging ,though very tiresome, helped me learn a lot.

2)I learnt how to utilize the existing sources and combine them together to buld something big. Also to add specific features into already existing code,it requires deep knowledge of the written code.

 3)Apart from the technical gains, I worked very hard and pushed my limits and learnt whatever is required.At first,I thought I can only make the basic feature and that would be great too but now after including more features everytime,I really feel confidence in me.From this program, I get a great startin Web-development and will surely try to refine the skills I gained. It won't be possible for me to learn so many things in such a short period ,if it was not for Engage.
